Three-Toed Slith Defenses

The three-toed slith of the tropical forests of the New World, is about the most defenseless creature in existence. It is poorly equipped to combat any enemy. It doesn't fight, hide or run away. It is an example of perpetual laziness and spends most of its time, when not eating leaves, hanging down from a tree branch grasped firmly by the three toes on each foot.

Speck	1	2	.333
Collins	0	3	.000

Results of games Wednesday night:

Eagan 14, Johnson 13; Clinge 9, Herren 9; Collins 5, Speck 9.

Tongue, Teeth Have to Do

With Voice, Word Sounds

There is a definite relationship between many speech defects, dental abnormalities, and various conditions in the mouth. Voice or word sounds are produced by a certain position or relationship of the hard and soft palate, teeth, cheeks and lips, with the tongue and the passage of expired air from the lungs. A change in the volume and resonance of expired air is varied by the lips.

The development of vowel sounds requires only the opening of the lips with a slight tongue motion. Consonants require somewhat more complicated movements of the lips and tongue and are named according to the part of the mouth used in their formation, namely, dental, nasal, alveolar and labial.

A number of mouth conditions affect speech habits very noticeably, according to a writer in the Detroit News. The overbait jaw is a very common cause of speech defects. The projection of the upper anterior teeth prevents good articulation with the lower anterior teeth.

The underbait jaw also affects the speech habits through changing the relationship of the tip of the tongue to the teeth. In both cases it is difficult for the lips to shape properly the sound or stop it at the right moment. The result is a lack of clear sound and/or removes much of the tone sharpness.

A high arched palate, missing teeth or spaces between the teeth, an open bite, cleft palate, lack of normal motility of the jaws, the abnormal position of various individual teeth, and other dental conditions of a similar character cause faulty articulation, leakage of air when sounds are made, and difficulty in making sounds.

Ancient Filling for Quills

Often in Colonial times filling for quills consisted of ungummed cotton. Not infrequently quills were filled with fleece very much like wool baid. But in early days fleece destined for such use was inadequately washed and consequently retained much of the natural animal oil, which in either heat or dampness gave forth a disagreeable odor, and was used out of necessity rather than choice. Worn woolen sheets and blankets also were used as quill fillings, after they had begun to fall into holes.
